

TOP-LOADING ARM

The top-loading arm is the most common choice for a liquid loading on a truck.

The pneumatic cylinder or gas spring balancer makes it easy and effortless to use.

The top-loading arm is tailored individually for each station and operating needs depending on used vehicles, environment, and operation. There is a wide range of optional equipment and functions to be selected. Overloading can be prevented with the level detector and harmful fumes can be handled with vapor collection cone.

The loading arm is CE-marked according to EU directive of machinery 2006/42/EC. It also fulfills the requirements of "Metallic industrial piping, EN 13480-1-4:2017" and pressure equipment directive 2014/68/EU (PED). Also EX-requirements fulfilling versions available.
